D.2	Crypto-assets name	Katana	Free alphanumerical text
D.3	Abbreviation	KAT	Free alphanumerical text
D.4	Crypto-asset project description	**Network Architecture.** The Network is an Ethereum Layer-2 built using the AggLayer Chain Development Kit in a zero-knowledge rollup configuration. Transactions are executed off-chain using an optimised Geth client (opGeth), with state transitions validated through zero-knowledge proofs that are verified on Ethereum, ensuring the integrity of the Network. **Network Purpose.** The Network is designed for decentralised finance (DeFi) use cases and provides a base layer enabling applications deployed on the Network to benefit from shared liquidity. Certain third-party DeFi protocols are integrated into the Network as independent embedded applications. The Network is not owned, operated or controlled by the Company. The Network Purpose is implemented in particular through chain-owned liquidity mechanisms and a vault-based bridging system that together support liquidity depth and treasury yield generation. Part E - Information about the offer to the public of crypto-assets or their admission to trading			
E.1	Public offering or admission to trading	ATTR	'OTPC' - offer to the public 'ATTR' - admission to trading
E.2	Reasons for public offer or admission to trading	The primary objective of the offer is to support the continued development and expansion of the Network and to encourage user participation within its ecosystem. The proceeds of the offer will be used to further develop the Network, strengthen its infrastructure and address the requirements of an expanding user base. The subsequent admission of the Token to trading is intended to facilitate broader market access and liquidity, thereby supporting ongoing engagement with and use of the Network. E.21	Subscription period beginning	Not applicable.	ISO 8601 date format (YYYY-MM-DD)
E.22	Subscription period end	Not applicable.	ISO 8601 date format (YYYY-MM-DD)
E.23	Safeguarding arrangements for offered funds/crypto- Assets	The proceeds of the offer will be subject to safeguarding arrangements provided by the confirmed launchpad, either directly or through third-party service providers engaged by the launchpad. Such safeguarding arrangements will be implemented in accordance with the requirements of Regulation (EU) 2023/1114.	Free alphanumerical text
E.24	Payment methods for crypto-asset purchase	When purchasing crypto-assets, the available payment methods can vary depending on the platform, the nature of the offering, and the specific project's infrastructure. **1. Centralised Exchanges (CEX)** Centralised exchanges are platforms where users can buy and sell crypto-assets using a variety of payment methods. Common options include: ● **Bank Transfers:** Many exchanges support direct bank transfers (SEPA, SWIFT, etc.), allowing users to deposit fiat currency (such as GBP, EUR, or USD) to purchase crypto-assets. ● **Credit/Debit Cards:** Some exchanges accept major credit and debit cards for	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		instant purchases, though fees may be higher. ● **Other Cryptocurrencies:** Users can often trade one cryptocurrency for another. ● **Third-Party Payment Providers:** Some platforms integrate with third-party payment service providers though this is less common. **2. Decentralised Exchanges (DEX)** Decentralised exchanges operate without intermediaries and typically require users to connect a crypto wallet. Payment methods here are more limited: ● **Cryptocurrency Swaps:** Users exchange one crypto-asset for another directly from their wallet. **Stablecoins:** Many DEXs support stablecoins (such as USDT, USDC, or DAI) as a medium of exchange.	
E.25	Value transfer methods for reimbursement	Offer Cancellation: In the event that the offer is cancelled, refunds will be processed using a payment method determined by the Company, taking into account the operational arrangements of the confirmed launchpad. Right of Withdrawal: Where a retail holder exercises their right of withdrawal, reimbursements will be made using the same method of payment as that used for the original contribution, unless otherwise expressly agreed with the retail holder. E.28	Transfer time schedule	Not applicable.	ISO 8601 date format (YYYY-MM-DD)
E.29	Purchaser's technical requirements	**Purchaser Requirements:** **Digital Wallet** ● **Blockchain Compatibility:** KAT tokens exist on the Ethereum blockchain. Purchasers must use a wallet that supports ERC-20 tokens. ● **Wallet Setup:** The wallet must be properly configured and secured with a strong password and backup recovery phrase (also known as a seed phrase). Users are responsible for safeguarding their private keys or recovery details. **Gas Fees** ● **Transaction Fees:** To transfer KAT tokens, you will need to pay for transaction (gas) fees on the applicable network. ● **Variable Fees:** Gas fees fluctuate depending on network congestion and transaction complexity. Ensure you have sufficient funds in your wallet to successfully complete transactions. **Exchange Account (if applicable)** ● **Centralised Exchanges (CEXs):** If purchasing KATthrough exchanges, you must create an account. ● **KYC Verification:** Most platforms require users to complete	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		Know Your Customer (KYC) checks to comply with regulatory standards. This may include submitting identity documents and proof of address. **Internet Connection** A stable internet connection is essential for using crypto wallets, performing transfers, and securely accessing CEX platforms **Software and Browser Requirements** ● **Browser Extensions:** Some browser-based wallets require supported browsers like Chrome or Firefox with the appropriate extension installed. ● **Desktop or Mobile Apps:** Some wallets require dedicated desktop or mobile apps for full functionality and token management. **Security Measures** ● **Private Key and Seed Phrase Storage:** Keep your recovery phrase and private keys offline and confidential. If lost, access to your KAT tokens may be permanently unrecoverable. **Two-Factor Authentication (2FA):** Always enable 2FA on centralised platforms to protect against unauthorised access.

G.19	Competent court	British Virgin Islands	Free alphanumerical text
Part H – information on the underlying technology			
H.1	Distributed ledger technology (DLT)	KAT is issued as an ERC-20 compatible token on the Ethereum blockchain. The Katana ecosystem operates as an Ethereum Layer 2 network built using the AggLayer Chain Development Kit (CDK) in a CDK-opgeth-zkRollup configuration. Transactions are executed on the Katana network using the opGeth execution client and validated through zero-knowledge proofs that are submitted to and verified by Ethereum. Accordingly, while KAT is issued on Ethereum, the Katana Layer 2 network derives its security and transaction finality from Ethereum's Proof of Stake consensus mechanism. Smart contracts govern the issuance, transfer and use of KAT within the ecosystem, and interoperability with Ethereum may be supported through bridge infrastructure.	Free alphanumerical text
H.2	Protocols and technical standards	The Token relies on the following protocols and	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		technologies: ● **Ethereum protocol.** As the Network operates as a Layer-2 solution, it relies on Ethereum for security and is inherently dependent on the proper functioning of the Ethereum protocol. ● **Network protocol.** The Token is issued and exists on the Network. Its creation, transfer and use are governed by the Network's rules, including the ERC-20-compatible standard applied to the Token. ● **Smart contracts.** The Token is used within Embedded Applications and Deployed Applications. Its use in these contexts is therefore subject to the smart contracts governing such applications. ● **Third-party infrastructure.** The Token and the Network rely on technologies provided by third-party service providers, including, among others, wallets, bridges and oracles. ● **Partner integrations.** Integrations with third-party partners interacting with the Network rely on application programming interfaces (APIs).	
H.3	Technology used	**Transfer** The issuance smart contracts, implemented in accordance with an ERC-20-compatible standard on the Network, define the technical rules governing the transfer of the Tokens. No	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		additional technology is required to transfer Tokens, as transfers are effected on the Network in accordance with its standard operation. Tokens may be bridged to other blockchain networks, including Ethereum, through third-party bridge solutions. **Holding and Storing** No additional technology is required to hold or store Tokens, as Tokens remain recorded on the Network in accordance with its standard operation. Token holders may, however, choose to use additional technologies or services for holding and security purposes, including wallets (such as multi-signature wallets), cold storage solutions, or other custody and security products and services.	
H.4	Consensus mechanism	**Ethereum** ● Ethereum operates under a proof-of-stake ("PoS") consensus mechanism, known as the Beacon Chain, which coordinates the network by selecting validators responsible for proposing and validating blocks. Validators are selected on the basis of the amount of ETH they have staked, rather than computational power, resulting in a significant reduction in energy consumption compared to the former proof-of-work mechanism. ● As of the date of this document, the Ethereum network comprises more than one million validators. ● Key features of Ethereum's PoS mechanism include:	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		o **Validators and staking:** Participation as a validator requires the staking of at least 32 ETH. Validators contribute to network security and may earn staking rewards. Participation is also possible through staking pools. o **Epochs and slots:** Time is structured into epochs and slots, which organise and coordinate the block proposal and validation process. o **Slashing mechanism:** Validators engaging in malicious or non-compliant behaviour may be subject to penalties, including the loss of a portion of their staked ETH. **Network** As a Layer-2 network built on Ethereum, the Network does not operate an independent consensus mechanism comparable to that of a Layer-1 blockchain. Instead, it derives its security and transaction finality from Ethereum's proof-of-stake consensus. The Network relies on a simplified sequencer or validator set, which is responsible solely for ordering transactions within the Layer-2 environment.	
H.5	Incentive mechanisms and applicable fees	Ethereum transactions, including the transfer of Tokens, require the payment of gas fees, which compensate validators for processing transactions and executing smart contracts. Following the implementation of Ethereum Improvement Proposal 1559 ("EIP-1559"),	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		transaction fees are partially determined through a base fee mechanism intended to improve fee predictability and to burn a portion of transaction fees, thereby reducing ETH issuance over time. As a result, Ethereum's fee structure comprises the following components: ● **Base fee:** a mandatory minimum fee that is burned with each transaction. The base fee adjusts dynamically based on network demand and, during periods of high activity, may result in ETH becoming deflationary where the amount burned exceeds issuance. ● **Priority fee (tip):** an optional additional fee paid by users to incentivise validators to prioritise the inclusion of their transactions. ● **Maximum fee:** the maximum total gas price that a user is willing to pay for a transaction, providing an upper limit on transaction costs. Trading platforms may also charge additional service fees in accordance with their own policies.	
H.6	Use of distributed ledger technology	false	'true' – Yes, DLT operated by the issuer or a third-party acting on the issuer's behalf 'false' – No, DLT not operated by the issuer or a third-party acting on the issuer's behalf

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
H.7	DLT functionality description	DLT is a digital system for recording transactions in which the transactions and their details are recorded in multiple places at the same time. Unlike traditional databases, distributed ledgers have no central data store or administration functionality. Instead, the ledger is decentralised, and consensus on the transactions is achieved through a process that involves multiple nodes, each maintaining its own copy of the ledger. The benefits of DLT include increased transparency, enhanced security, improved traceability, and greater efficiency of transactions.	Free alphanumerical text
H.8	Audit	True	'true' – Yes 'false' – No
H.9	Audit outcome	Katana follows recognised industry practices to promote the secure development of its smart contracts. In this context, the Network's core smart contracts have been subject to security audits, which are publicly available at: https://katana.network/blog/wake-up-samurai-katana-is-here. In addition, security audits and formal verification of the Token smart contracts have been conducted by Certora, with the relevant reports made publicly available. In line with transparency best practices, Katana makes its smart contract source code publicly accessible, allowing independent security researchers to review the code and assess potential vulnerabilities. **Disclaimer.** While security audits and formal verification processes are intended to strengthen the overall security of the smart	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		contracts, they do not guarantee the absence of vulnerabilities. Undetected issues or new attack vectors may still arise. Token holders should take these risks into account. See also Part I (Risk Factors).	
Part I – Information on risks			
I.1	Offer-related risks	**General Risk Disclosure** The offering and trading of KAT tokens involve several risks commonly associated with the broader crypto-asset market, especially within centralised exchange environments, staking mechanisms, and decentralised finance (DeFi) applications tied to the Katana ecosystem. **Market Volatility** The value of KAT may experience significant volatility due to shifts in market sentiment, macroeconomic trends, protocol updates, and activity across exchanges. Such fluctuations can lead to financial losses for holders or short-term traders and may affect the perceived value of KAT utility. **Liquidity Risk** There is no guarantee that KAT will maintain sufficient liquidity or consistent trading volume across supported exchanges. Liquidity constraints may arise from limited market activity, uneven token distribution, or broader market downturns, making it difficult to efficiently buy or sell KAT at stable prices. **Regulatory Risk** As global regulatory frameworks for crypto-assets evolve, KAT may be affected by new compliance requirements. These could impact the availability of KAT on certain exchanges, restrict marketing or token offerings in specific regions, or impose	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		new disclosure, tax, or governance obligations. **AML/KYC Compliance** When purchasing or trading KAT via centralised platforms, users are generally required to complete AML and KYC verification. Failure to comply with such procedures can result in restricted access, delayed withdrawals, or account suspensions, depending on the platform and local regulations. **Market Manipulation** As with most tradable digital assets, KAT is exposed to potential manipulative practices such as wash trading, spoofing, or pump-and-dump schemes. These behaviours may artificially inflate or depress market prices, compromising fair price discovery and increasing volatility. **Operational Risk** The performance and utility of KAT depend on the reliable functioning of the network and smart contract-based platforms. Risks include smart contract bugs, network congestion, gas price spikes, or failures in off-chain infrastructure (e.g., bridges or oracles). **Token Utility Risk** KAT value is tied to its function in protocol governance, staking, and ecosystem coordination. If KAT fails to grow, or if adoption of its core products declines, the demand and utility of KAT may weaken. Delays in technical upgrades or reduced community engagement could also adversely affect token perception.	
I.2	Issuer-related risks	**Issuer and Governance** The token is not issued by a regulated financial institution and governance is community driven and changes (if applicable) depend on the core	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		development team and protocol governance structure. **Project Continuity Risk** The KAT development team are responsible for maintaining the protocol and surrounding infrastructure. If funding, development activity, or user adoption materially declines, the issuer may reduce or cease operations, which could impair the token's utility and long-term viability. **Brand and Ecosystem Dependency** The value of the KAT token is closely connected to the reputation, adoption, and user base of the Katana ecosystem and affiliated products. A decline in platform usage, negative media coverage, or more competitive offerings in the exchange space may adversely impact KAT market value and utility. **Regulatory Exposure** Operating across multiple jurisdictions, the KAT token is exposed to varying legal frameworks, including potential restrictions on exchange operations or token listings. Regulatory developments may require significant operational changes or affect the legal standing of KAT tokens.	
I.3	Crypto-assets-related risks	**Speculative Nature** KAT is a crypto-asset whose value is derived from its role in the Katana ecosystem . As with most crypto-assets, KAT is inherently speculative and subject to significant price volatility, influenced by user participation, network activity, market sentiment, and broader macroeconomic conditions.	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		Custodial Risk Where KAT Tokens are held through Revolut Digital Assets Europe Ltd, users are not solely responsible for safeguarding the private keys associated with their Tokens, as such private keys are held by the custodian in accordance with its custody arrangements. **Future Use Cases** While KAT is currently used for on-chain governance and ecosystem alignment within the Katana Ecosystem network, its utility may evolve. Future uses could include new DeFi integrations, cross-chain coordination roles, or deeper involvement in infrastructure tooling. However, these potential developments are not guaranteed and depend on community decisions, developer commitment, and the ongoing success of Katana ecosystem -related projects.	
I.4	Project implementation-related risks	**Technical Limitations** New product features, liquidity strategies, or integrations may be delayed or limited by technical hurdles, resource constraints, or unanticipated security flaws. **Regulatory Developments** Increasing scrutiny of centralised platforms may result in the need for protocol restructuring, jurisdictional restrictions, or more extensive reporting obligations. **Third-Party Reliance** The Katana ecosystem relies on partnerships with liquidity providers, custodians, and infrastructure partners. Disruptions to these relationships or operational failures among third	Free alphanumerical text

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
		parties may reduce token effectiveness or compromise platform performance.	
I.5	Technology-related risks	**Network Disruptions** Issues on blockchain or the Katana ecosystem may impact token transfers. Network congestion, outages, or protocol-level changes could lead to delays or failures in transaction execution. **Exchange Integration Risks** Trading KAT on centralised exchanges (CEXs) or decentralised exchanges (DEXs) may expose users to: ● Slippage, especially during periods of low liquidity or market volatility ● Front-running or manipulation by automated bots on DEXs ● Delisting risks, where CEXs may remove support for KAT due to strategic, technical, or regulatory reasons Custodial risk, where funds held on CEXs may be lost in the event of platform hacks, bankruptcy, or internal failure	Free alphanumerical text
I.6	Mitigation measures	**Exchange Availability** KAT is listed on leading exchanges enhancing access and liquidity. **User Engagement** KAT's utility within the Katana ecosystem drives user engagement. **Communication** The KAT team publishes regular updates, supports an active user community, and shares development progress through its website and social media.	Free alphanumerical text
Part J – Information on the sustainability indicators in relation to adverse impact on the climate and other environment-related adverse impacts			

No	FIELD	CONTENT TO BE REPORTED	FORM AND STANDARDS TO BE USED FOR REPORTING
J.1	Adverse impacts on climate and other environment- related adverse impacts	KAT inherits Ethereum's consensus mechanism—which, is now Proof of Stake (PoS). Proof of Stake (PoS) is a consensus mechanism where validators are chosen to confirm transactions and secure the network based on the amount of cryptocurrency they "stake" as collateral rather than performing energy-intensive computations like Proof of Work (PoW). This PoS approach is far more energy-efficient compared to Bitcoin PoW mining.	Free alphanumerical text
